

Endless Loading

The Endless Loading script is designed to work with BigCommerce new templates directly. However, customized templates might need some minor adjustment.

Installation Steps:

- Extract the zip file files into your “content/” folder (using WebDAV).
- Upload the files to your BigCommerce store.
- Edit your “category.html” file and add the following either to the head section or the bottom of the body

```
<script type="text/javascript" src="%%GLOBAL_ShopPath%%/content/js/endless_paging.js"></script>
```

```
<link rel="stylesheet" type="text/css"
```

```
href="%%GLOBAL_ShopPath%%/content/styles/endless_paging.css"/>
```

- If you uploaded the files into a different folder, adjust the paths accordingly.

Customization:

In the “/js/endless_paging.js”, you can customize the script to fit your template. The following variables on the top of the file will help with the customization:

- **max_auto_load**: is the number of pages to automatically load before the user has to click on “Load more” button.
- **parent_div**: the HTML DIV id that holds the products list, comparison form, etc...
- **products_parent_tag**: the parent HTML tag that holds all the products.
- **products_tag**: the HTML tag for each product. This is used to clear content between each page.
- **css_prefix**: a new class name that will be added to each products parent tag.
- **paging_class_name**: the pagination DIVs class name.
- **paging_ul**: the parent HTML element that holds the page numbers
- **paging_li**: the HTML element that holds the page number and link
- **paging_class**: the class name that will be added to the new “Load More” DIV
- **load_more_class**: the class name for the “Load More” text
- **loading_class**: the class name to add when the “Load More” DIV is loading
- **load_more_text**: the text to use for “Load More”
- **show_page_numbers**: either show the page number on the right of the products list or not.
